

Two-phase AGN clumpy torus model and SED library

- Torus structure : clump+disk+envelope
- Dust properties : fluffy grains
- SED library : 5 parameters
- Examples:
 - low starburst contribution
 - "pure" AGN

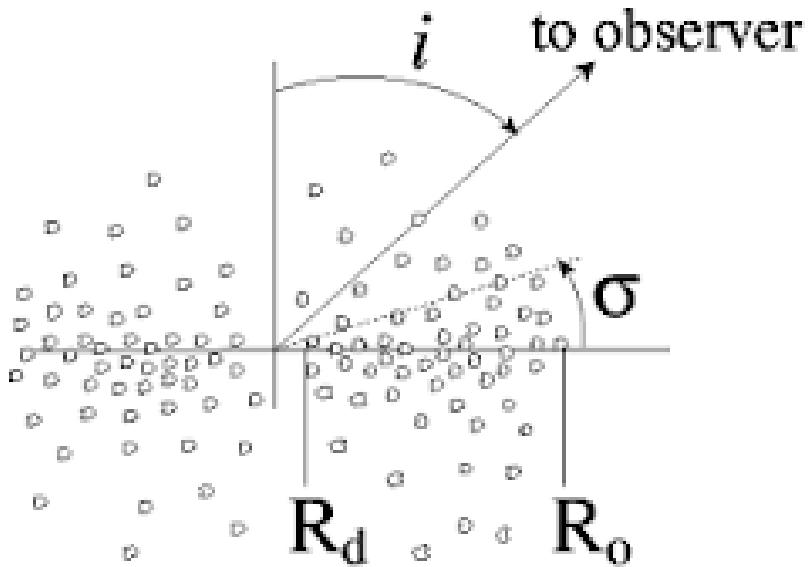

Homogenous \leftrightarrow clumpy AGN torus models

Homogenous disks because of challenges in RT
Pier & Krolik 1992, Efstathiou & Rowan-Robinson 1993, ...

Elitzur et al. 2001,
Nenkova et al. 2008,
Hönig & Kishimoto 2010,

Caveats on clumpy AGN torus models

Challenges in RT:

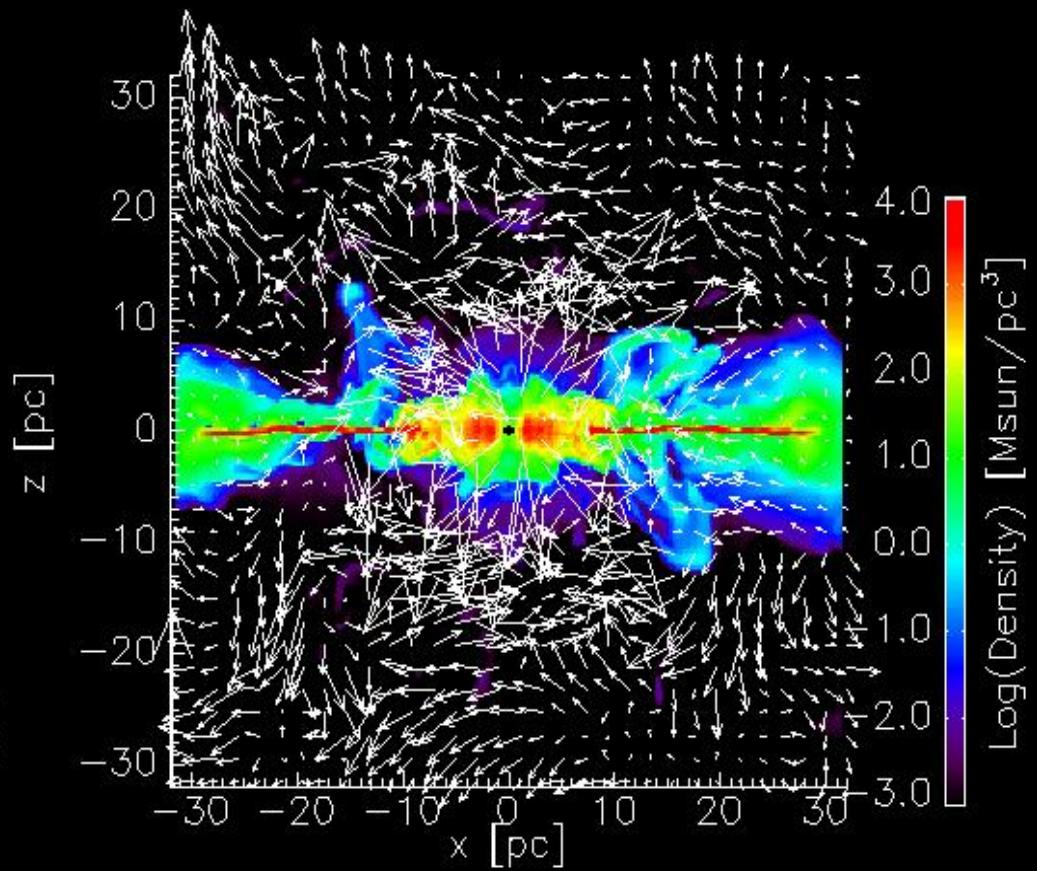

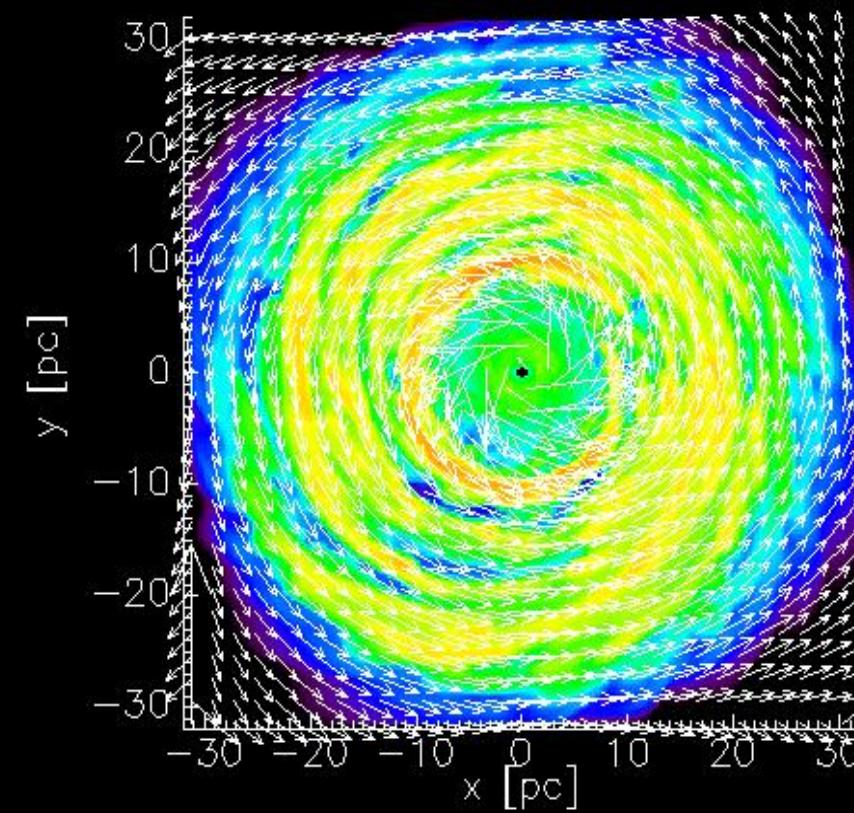

- Statistical arguments
- Energy balance ~5%
- No clump heating from disk
- Shadowing effects
- 9-11 free parameters

Hydro-dynamical simulation of AGN torus structure

Dust in polar region of AGN torus

VLT I: Burtscher et al. 2013, Hönig et al. 2013, Tristram et al. 2014,
Review by Netzer 2015

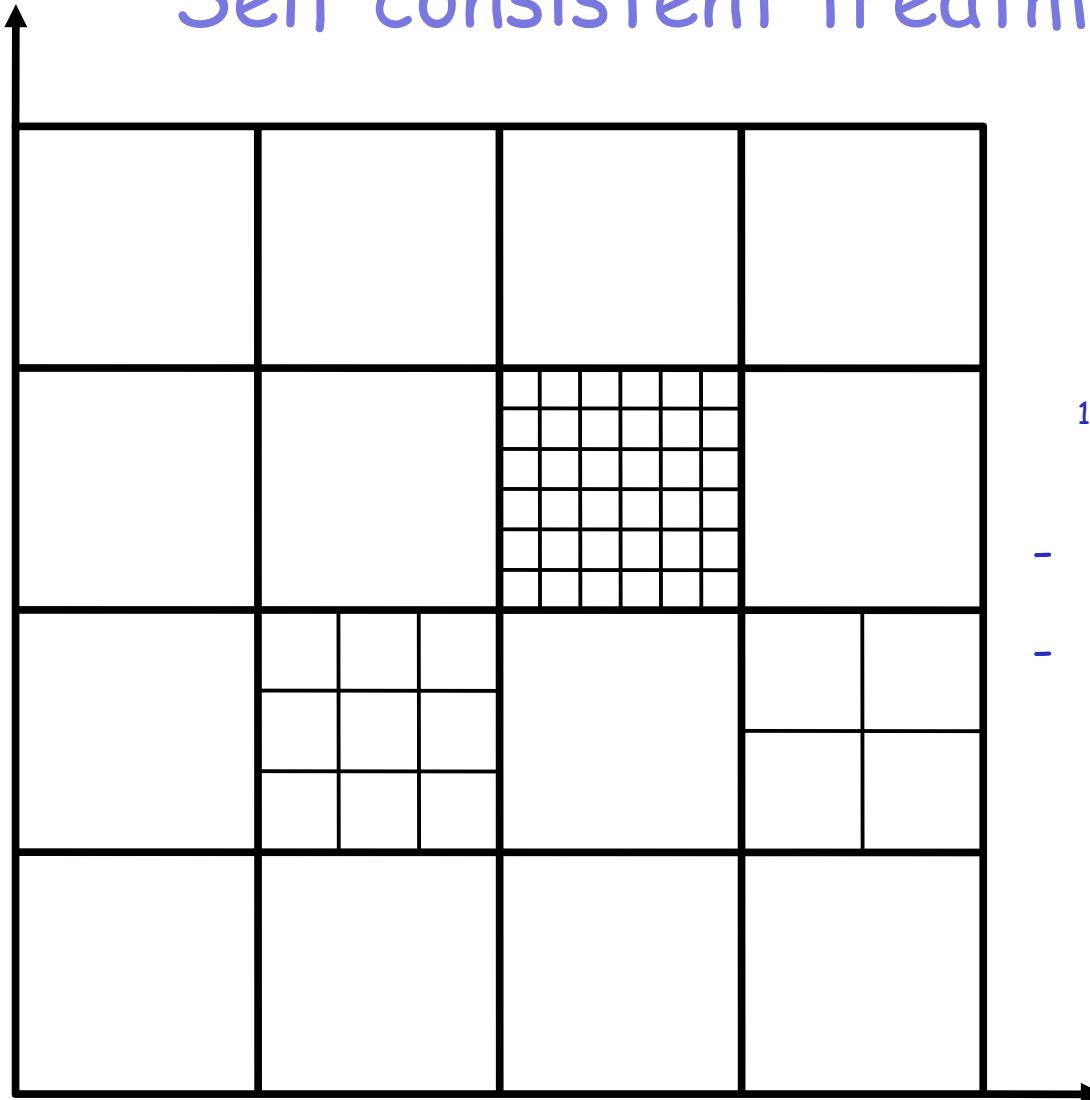

Phenomenological AGN torus structure

3D Monte Carlo radiative transfer

Self consistent treatment

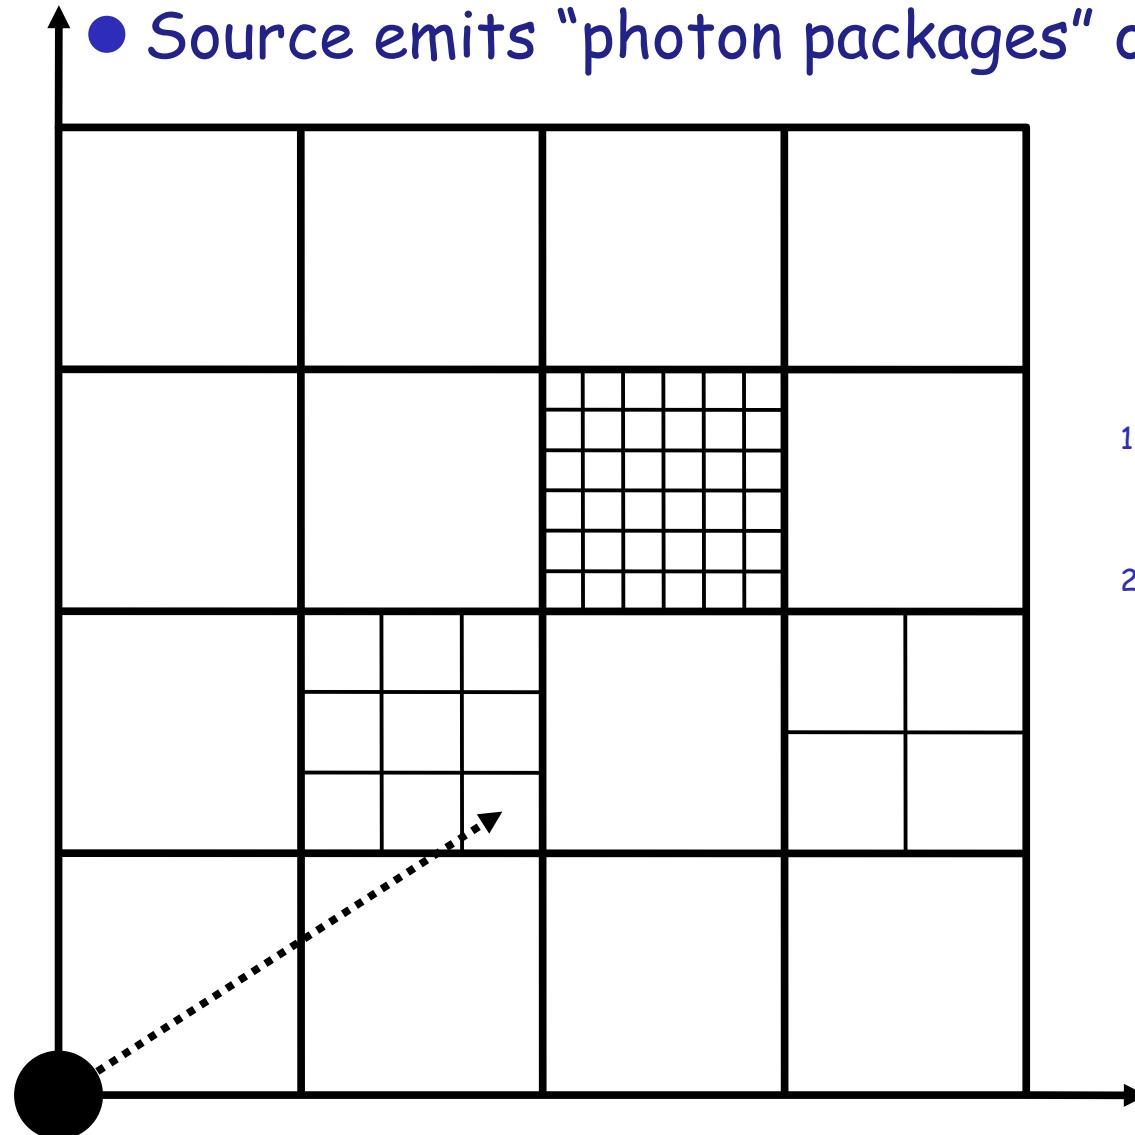

1. Geometry:

- Arbitrary dust distribution
- Pseudo adaptive mesh important for clumps

3D Monte Carlo radiative transfer

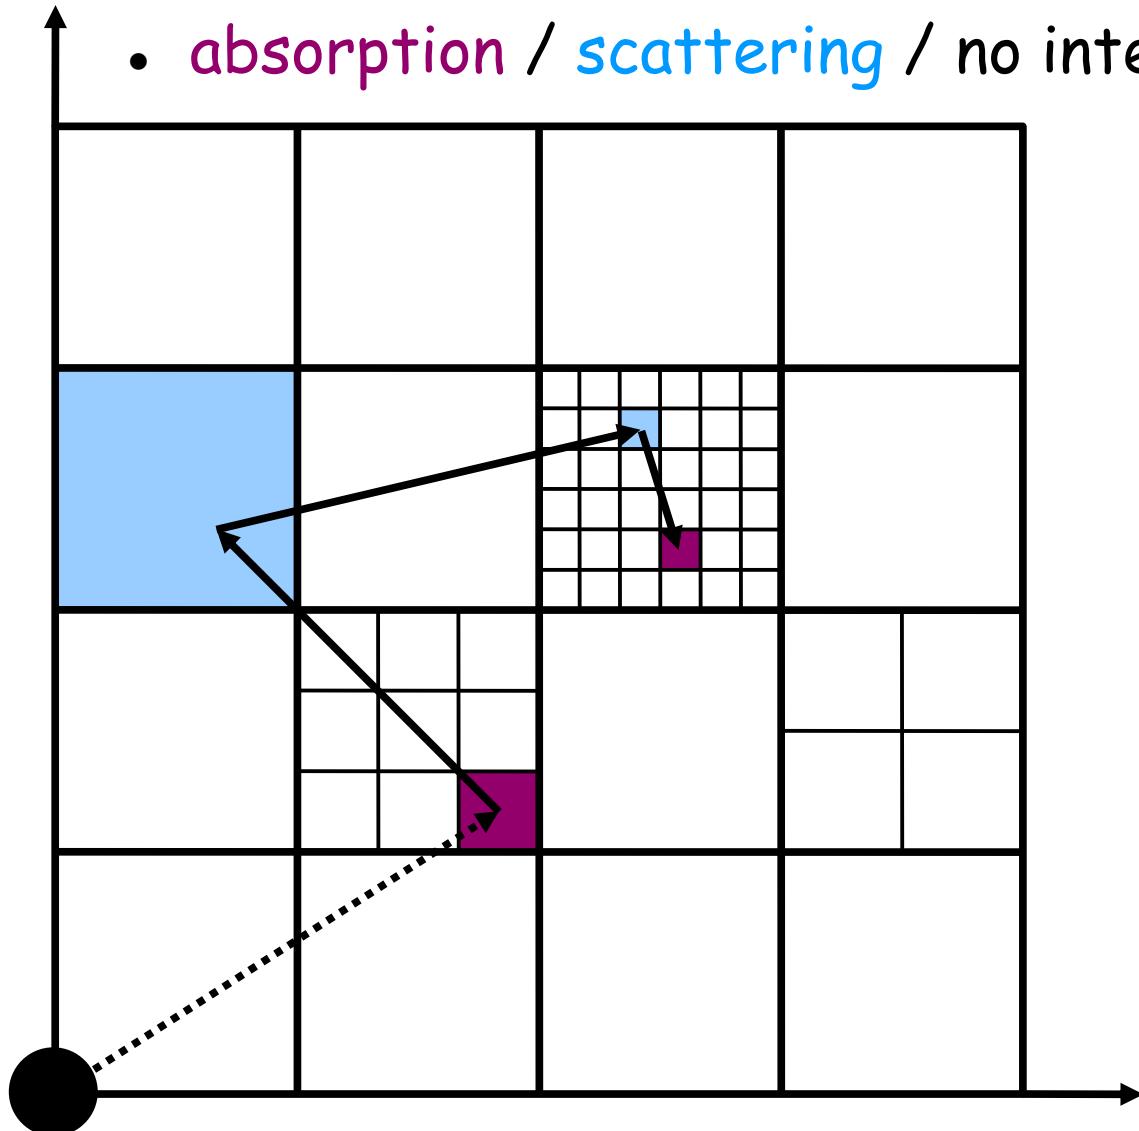

- Source emits “photon packages” of equal energy

1. Geometry
2. Source

3D Monte Carlo radiative transfer

- absorption / scattering / no interaction

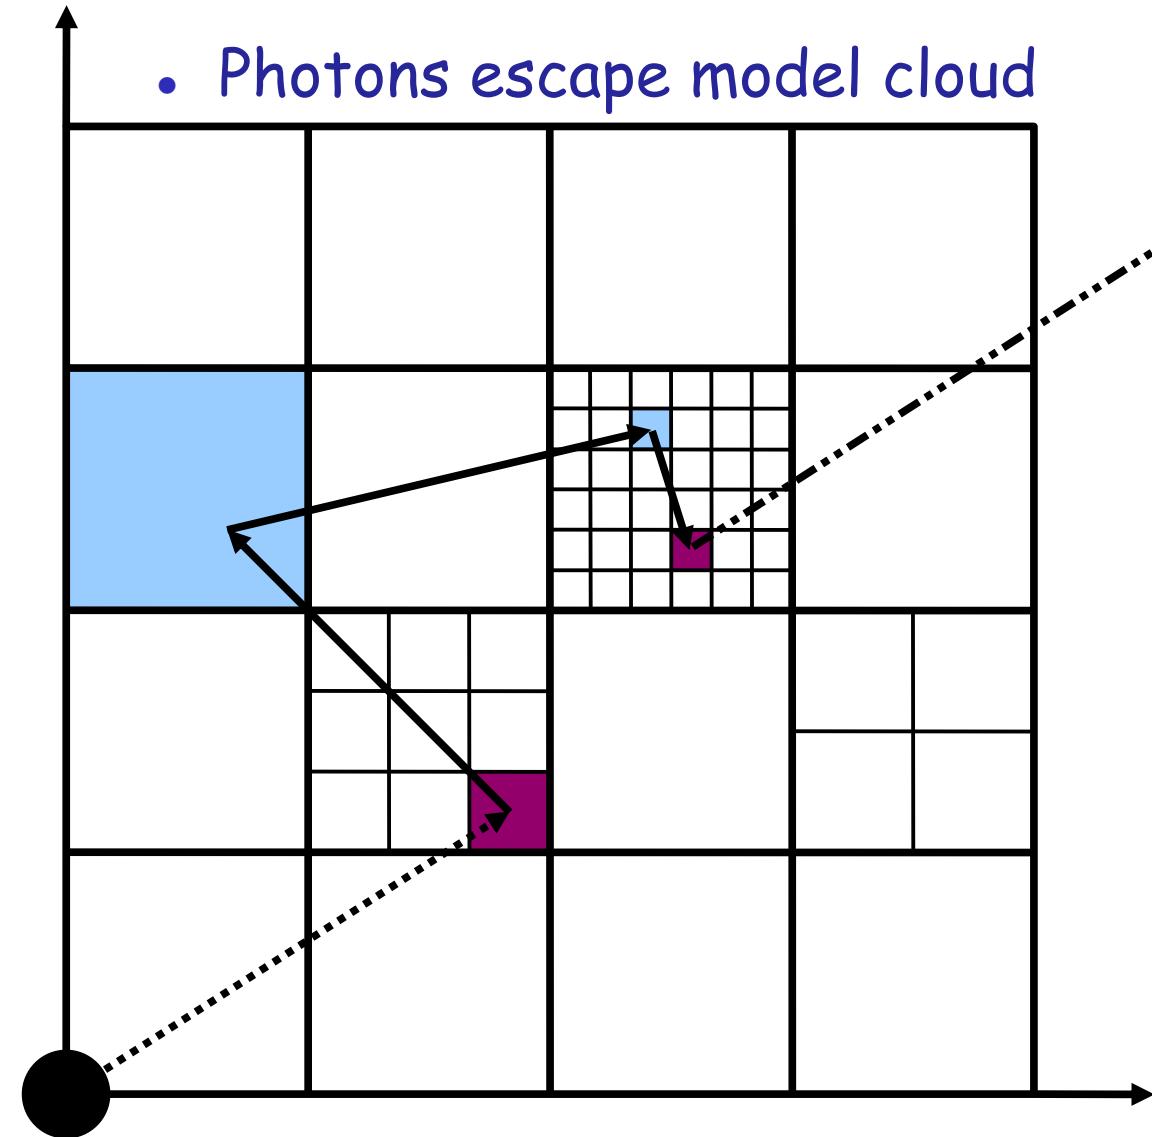

$$\tau = -\ln(\zeta)$$

1. Geometry
2. Source
3. Inter-action
4. Dust temperature

3D Monte Carlo radiative transfer

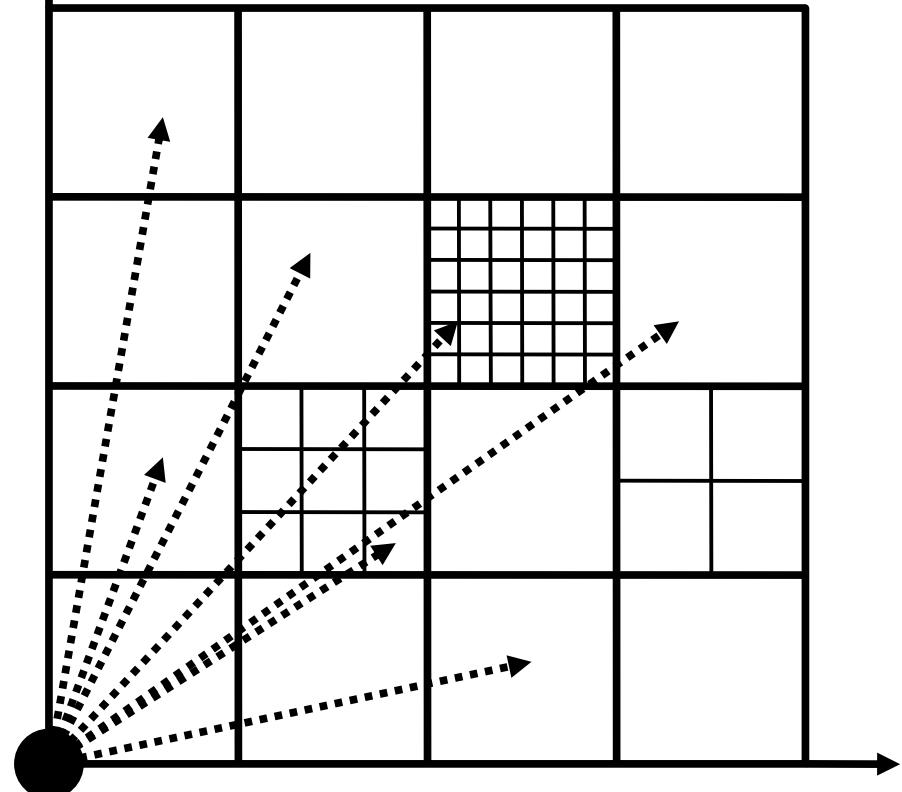

- Photons escape model cloud

1. Geometry
 2. Source
 3. Inter-action
 4. Dust temperature
 5. Detection
- Time as 4thdimension
(Light echo's)

Vectorised 3D Monte Carlo

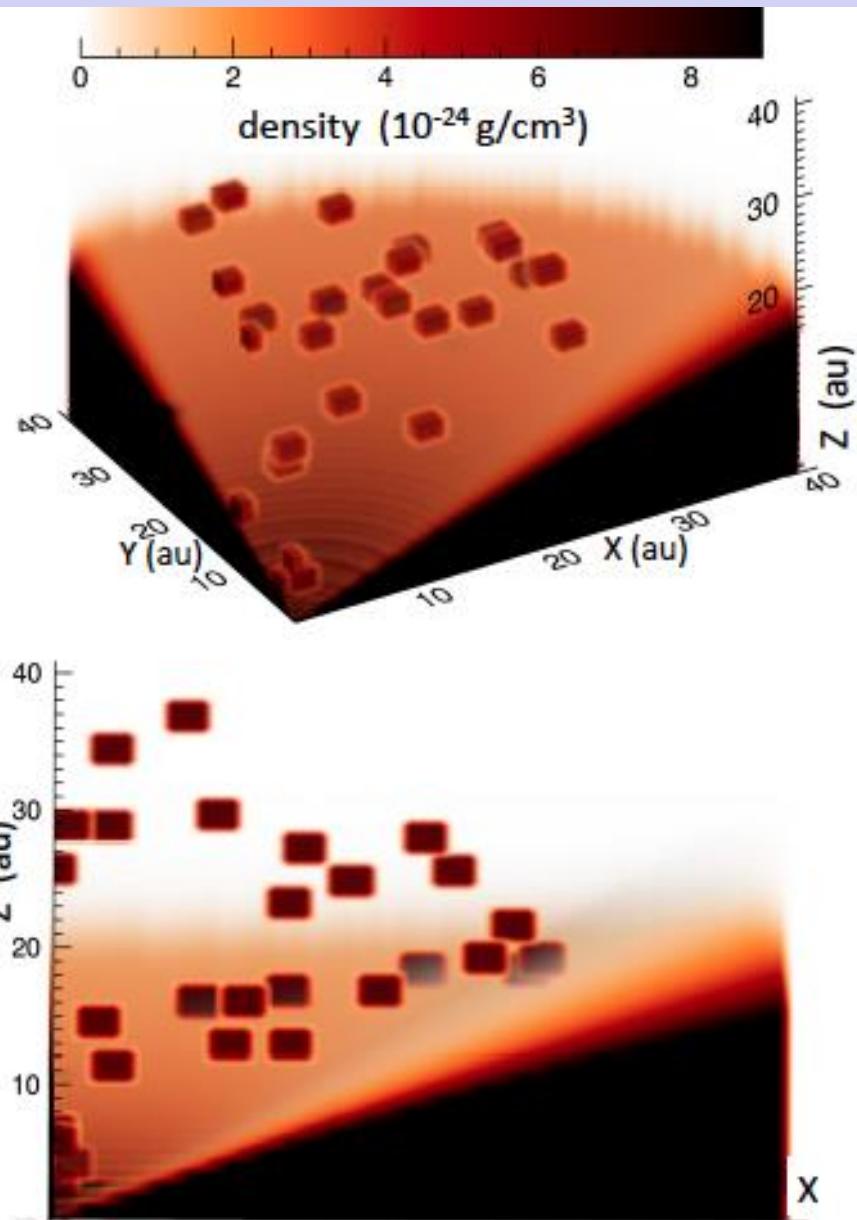

- Multiple photons at a time → faster !

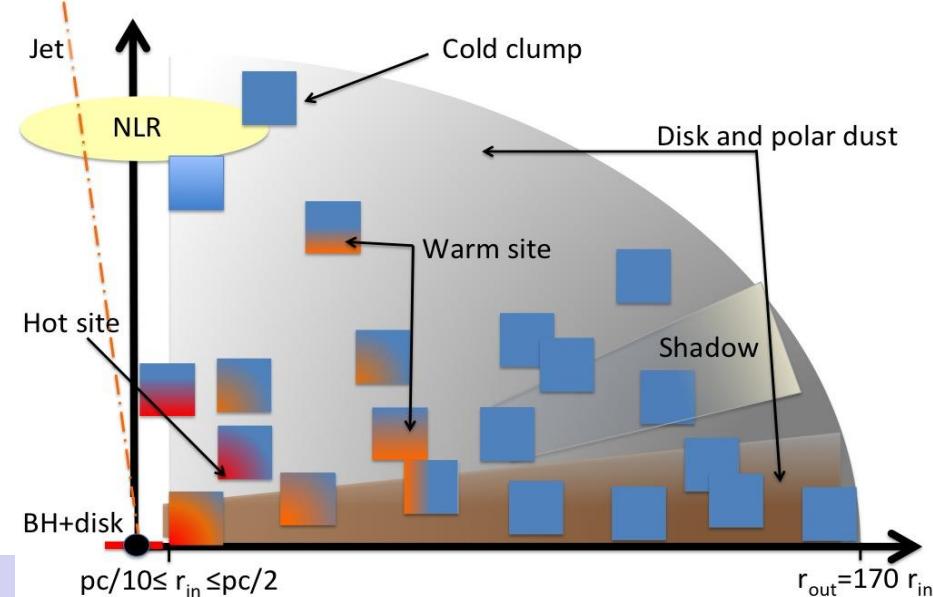

Challenges:

- ❖ Cell locked when hit by photon
- ❖ Parallel random number generator
(Mersene Twister)
- ❖ Graphical Processing Units (CUDA)

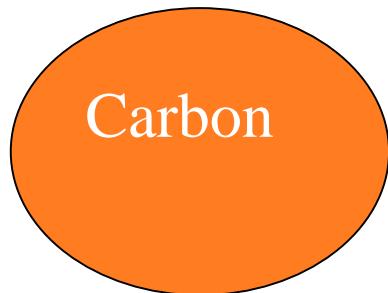

Dust density distribution

Siebenmorgen et al. (2015)

ISM dust \longleftrightarrow fluffy grains

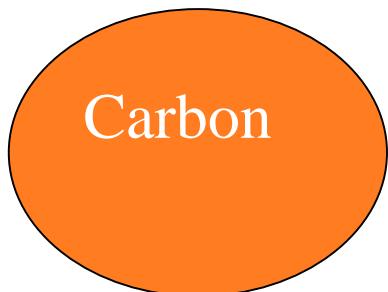

+

diffuse ISM
 $n \sim 1$ atom/cm³

Draine 2011, Feltre et al 2012, Jones et al. 2014, Siebenmorgen et al. 2014

ISM dust \longleftrightarrow fluffy grains

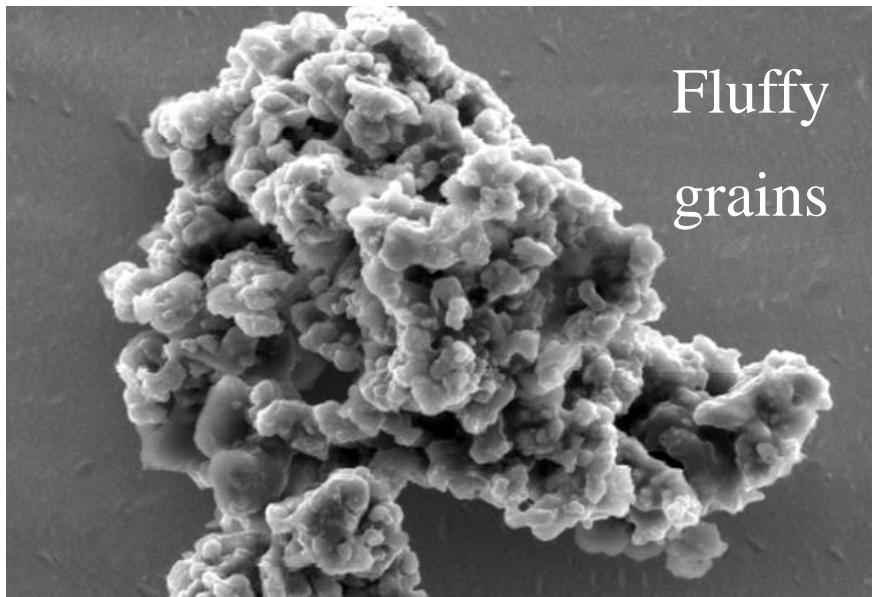

+

diffuse ISM
 $n \sim 1$ atom/cm³

Draine 2011, Feltre et al 2012, Jones et al. 2014, Siebenmorgen et al. 2014

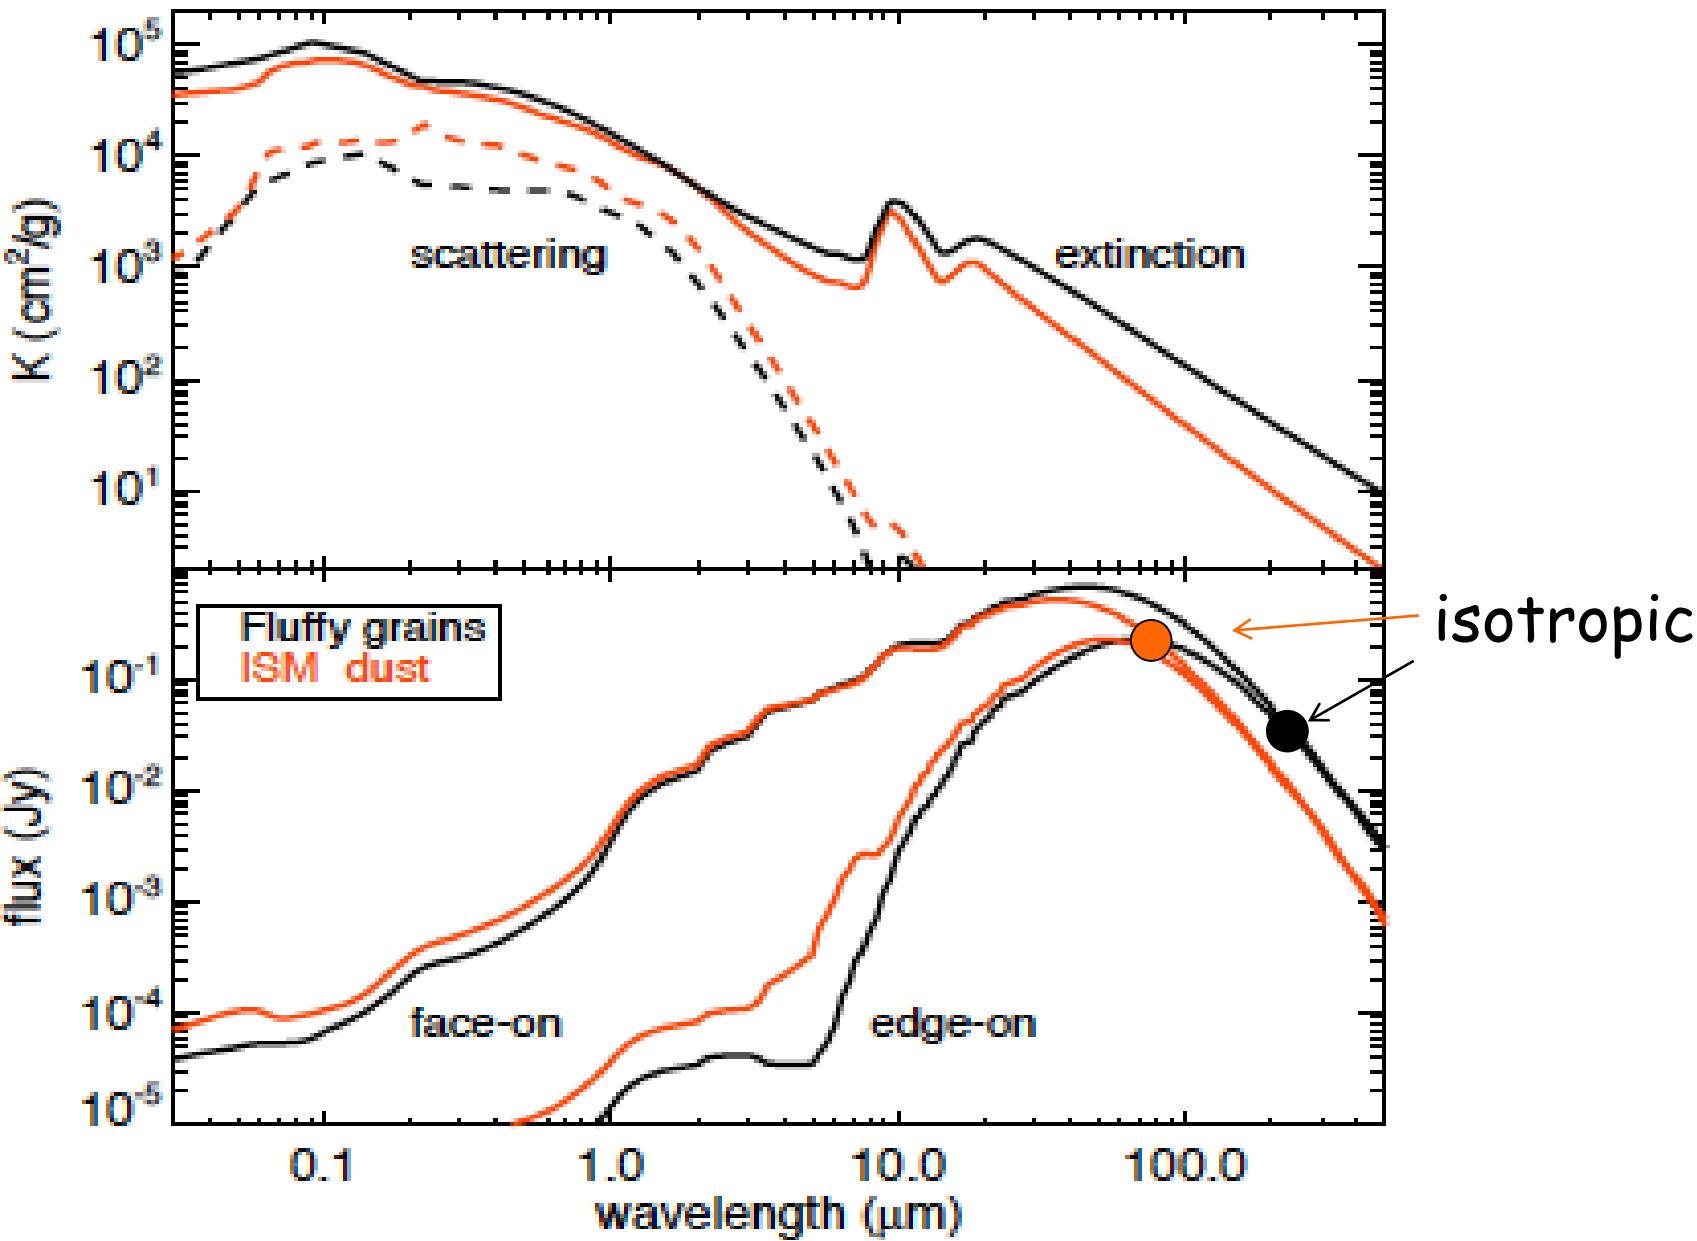

Fluffy
grains

AGN dust
 $n \sim 10^{2...6}$ atom/cm³

Krügel & Siebenmorgen 1994

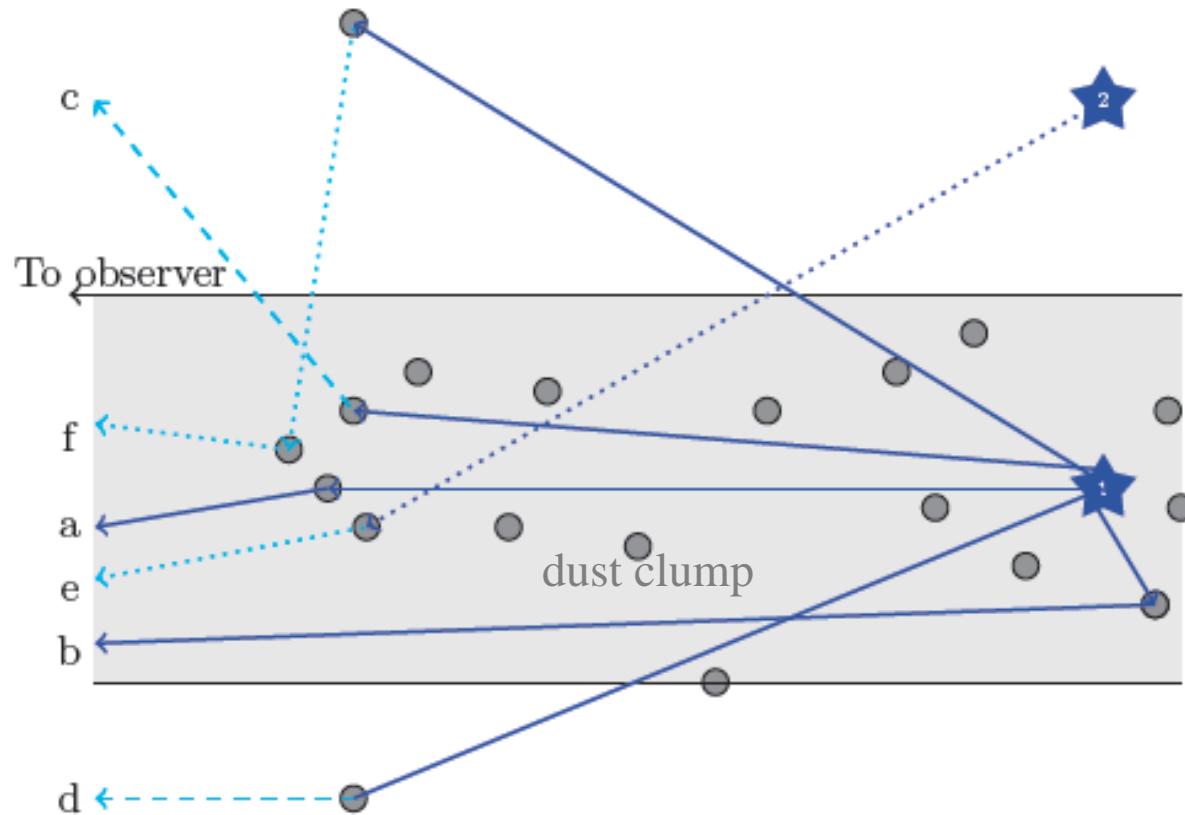

ISM dust \longleftrightarrow fluffy grains

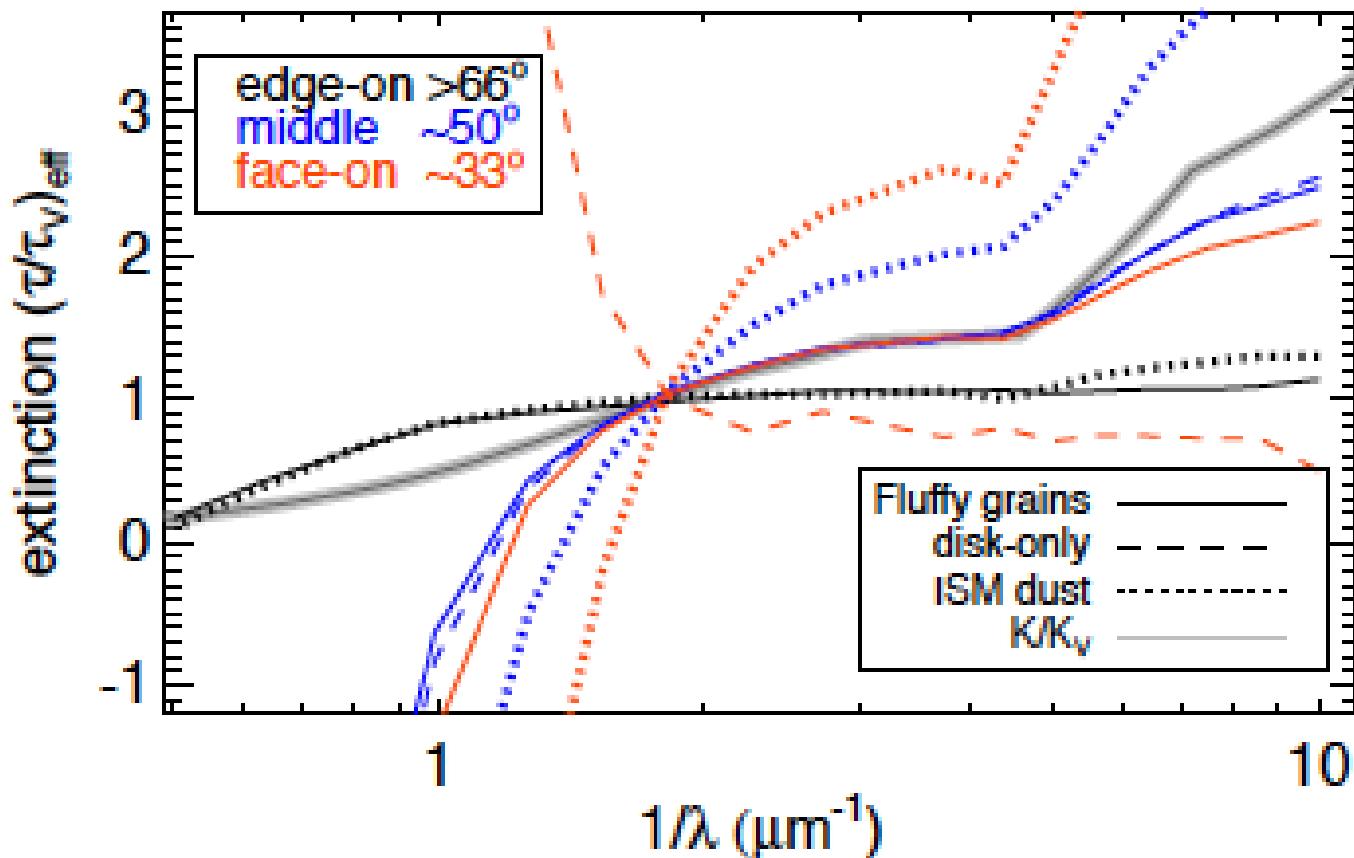

Caveat on extinction measurements

Scattering in or
out-of-the beam

$$T_{\text{eff}} = - \ln \frac{F_{\text{obs}}}{F_{\text{md}}}$$

AGN torus extinction \longleftrightarrow viewing angle

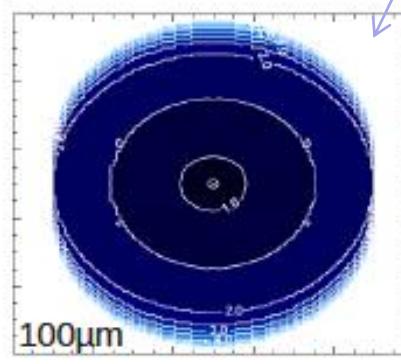

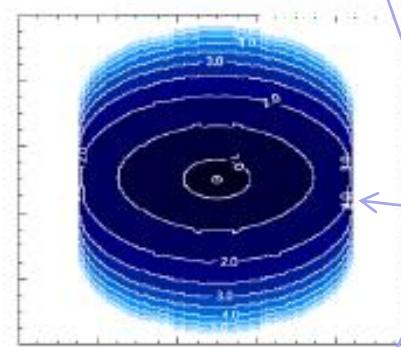

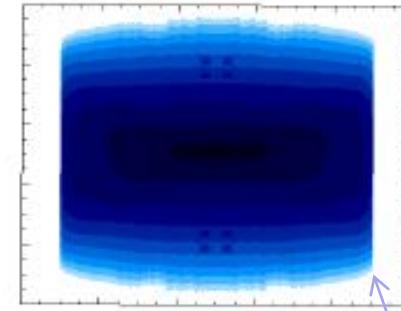

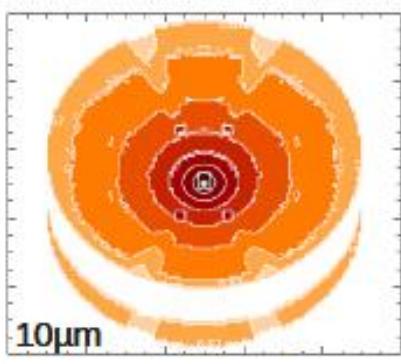

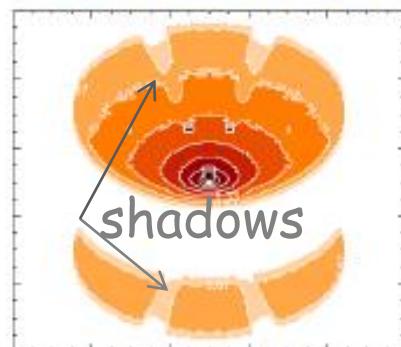

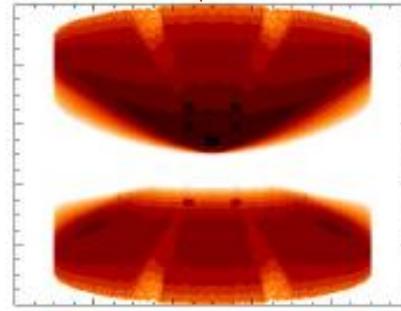

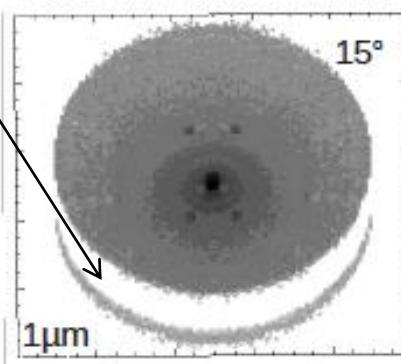

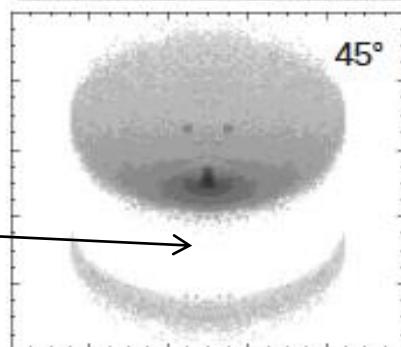

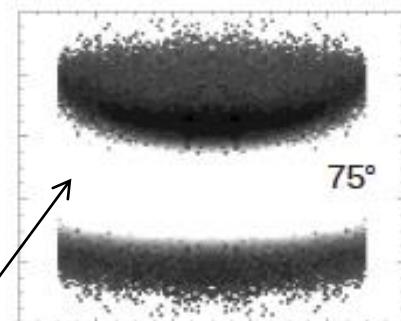

\rightarrow No 1:1 link to dust properties !

AGN imaging

polar dust

disk

isotropic

face-on

SED library of AGN

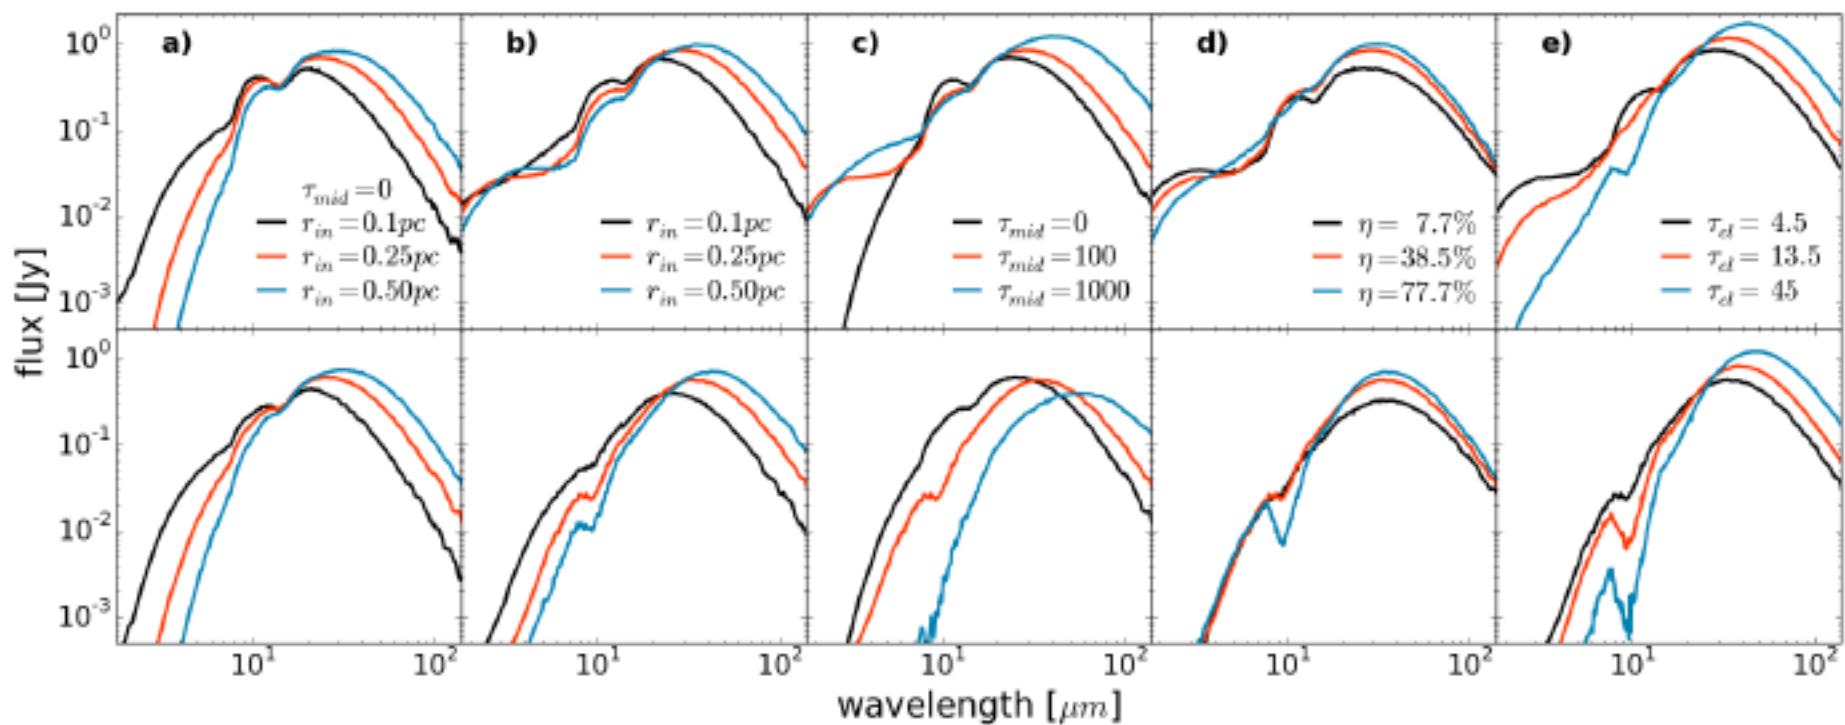

Minimum set of 5 free parameters

- 1) Viewing angle
- 2) Inner radius
- 3) Cloud filling factor
- 4) Optical depth of clouds
- 5) Optical depth of disk midplane

Library includes ~3600 SEDs

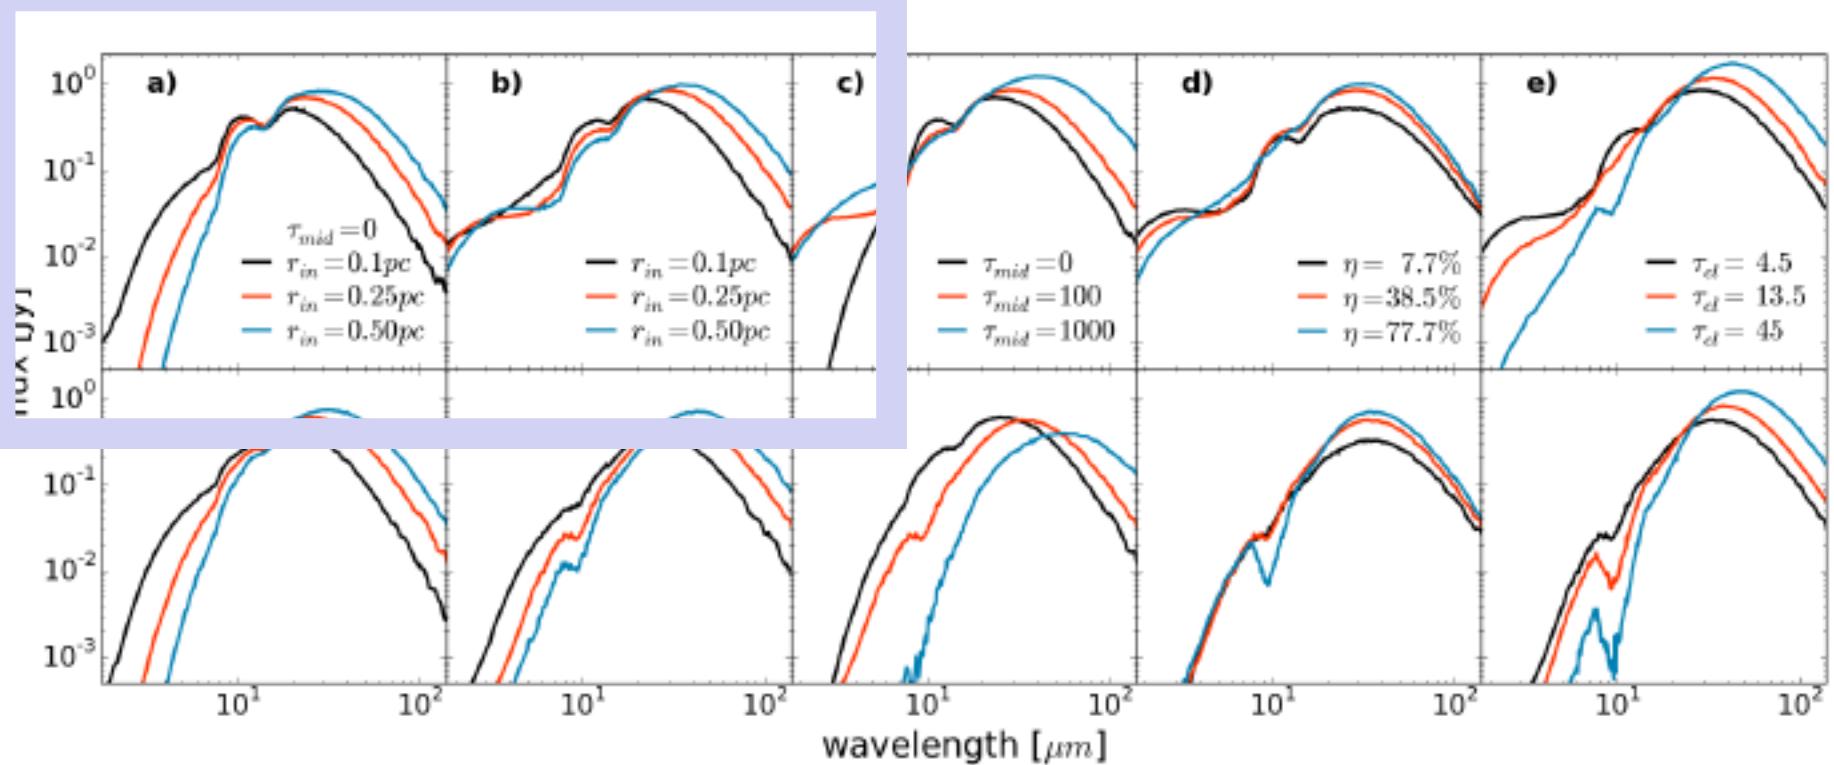

Impact of AGN parameters on SED

Gonzales- Martin et al 2013
Esquej et al. 2014
Ruschel-Dutra et al 2014
Ichikawa et al 2015, ...

Herschel+Spitzer sample of 3C (z<1)

- 87 detection(Westhues '16)

Silicate absorbtion

6 with $\tau_{\text{Si}} > 1$

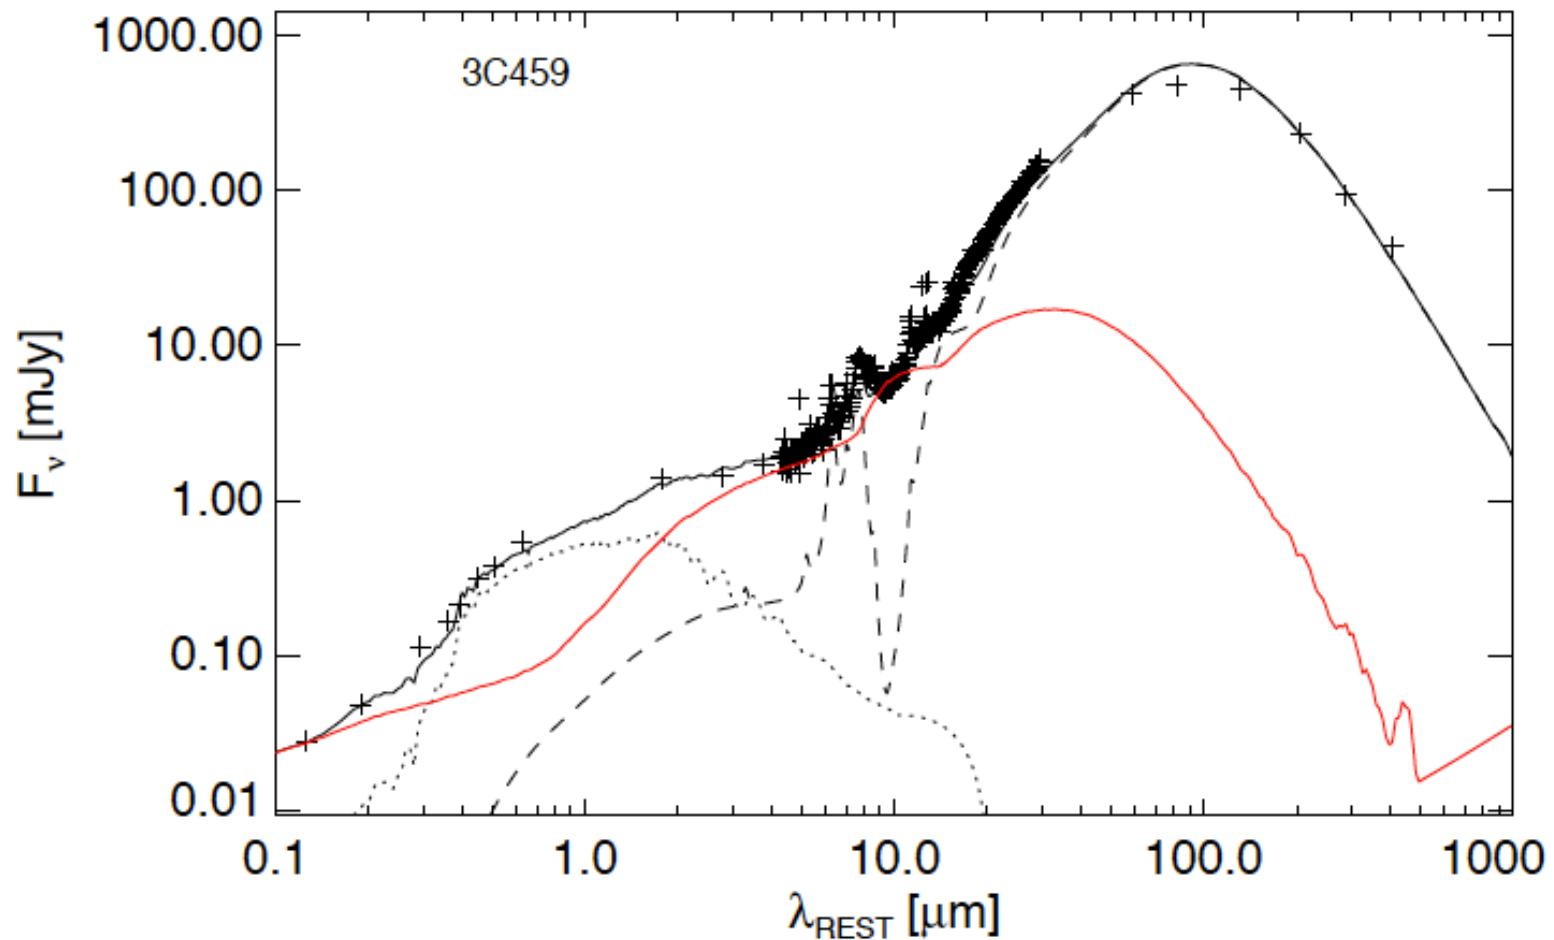

Baysian fit:

- Host (Bruzal'03) +
- AGN +
- Starburst

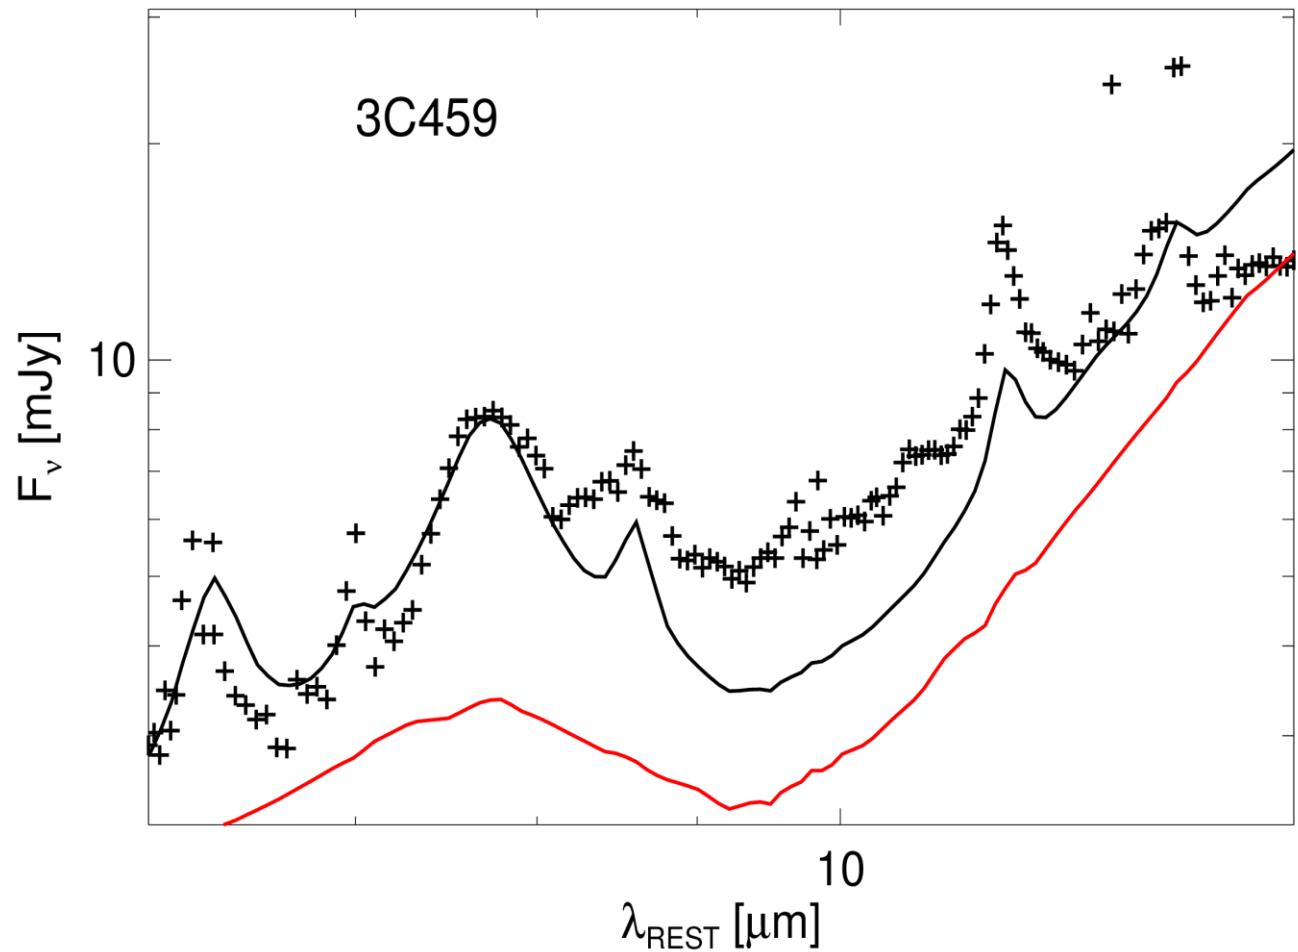

Herschel+Spitzer sample of 3C (z<1)

- 87 detection(Westhues '16)
- **2 with PAH emission**

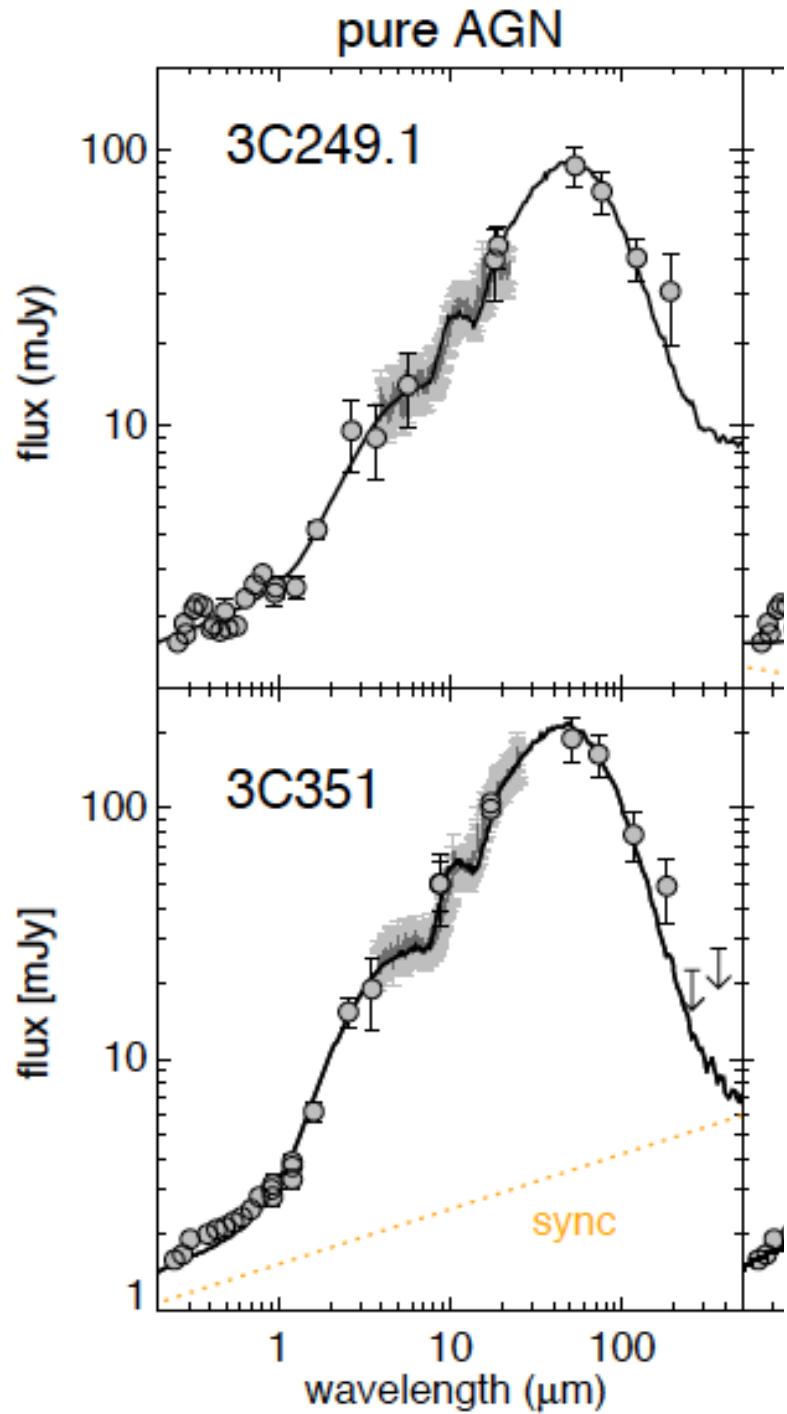

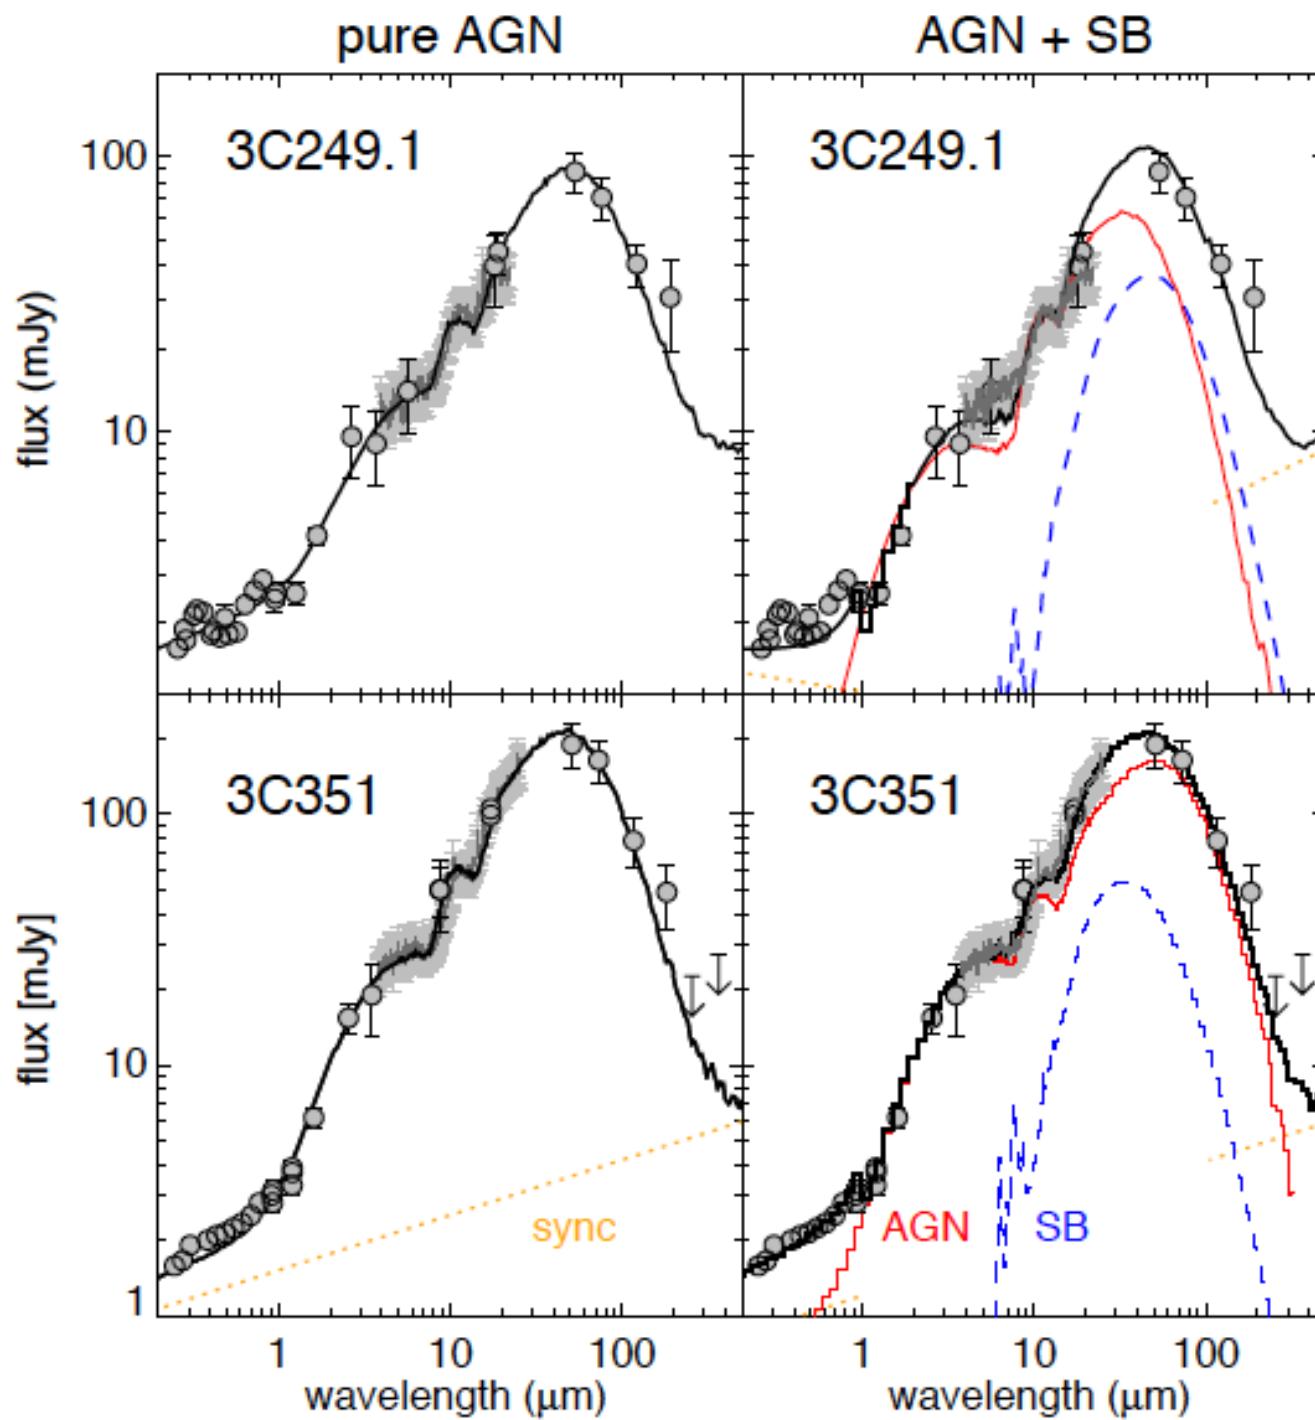

Herschel+Spitzer sample of 3C (z<1)

- 87 detection(Westhues '16)
- **2 with PAH emission**

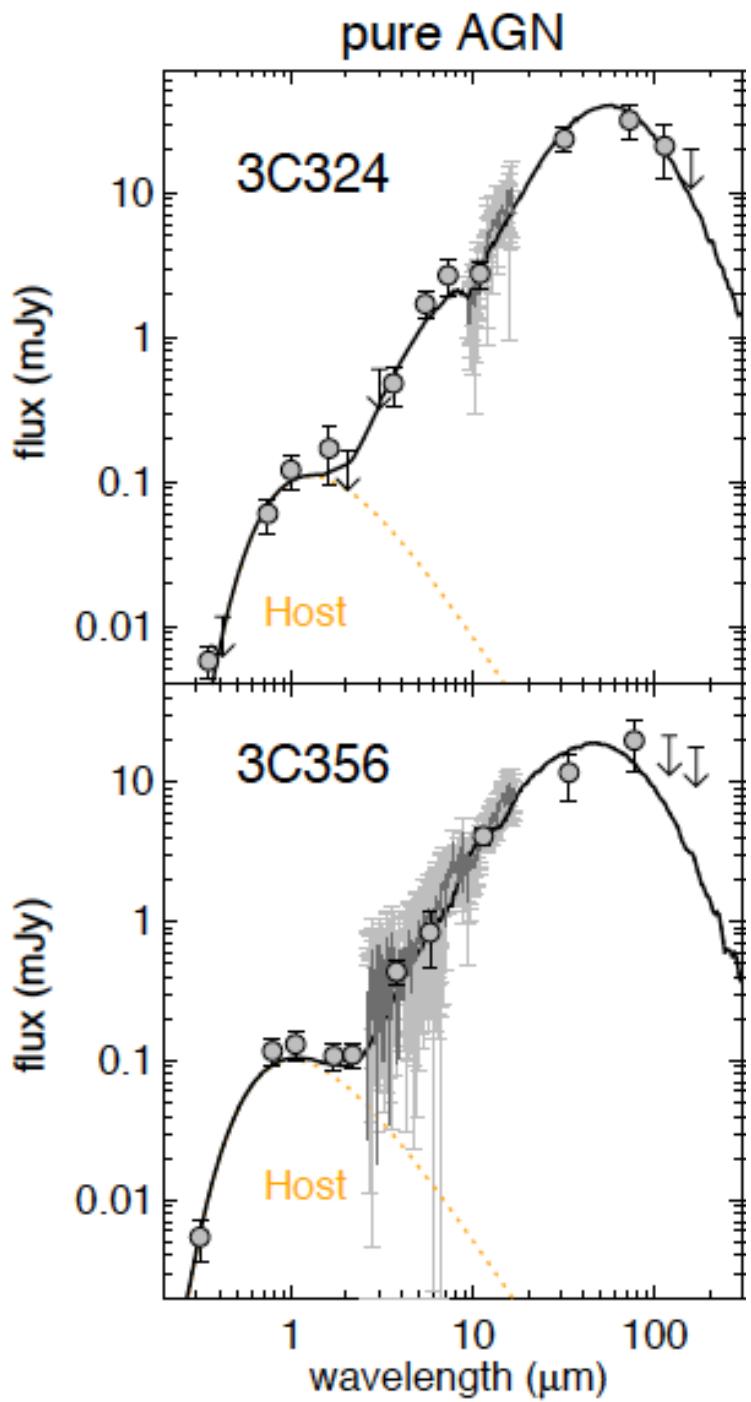

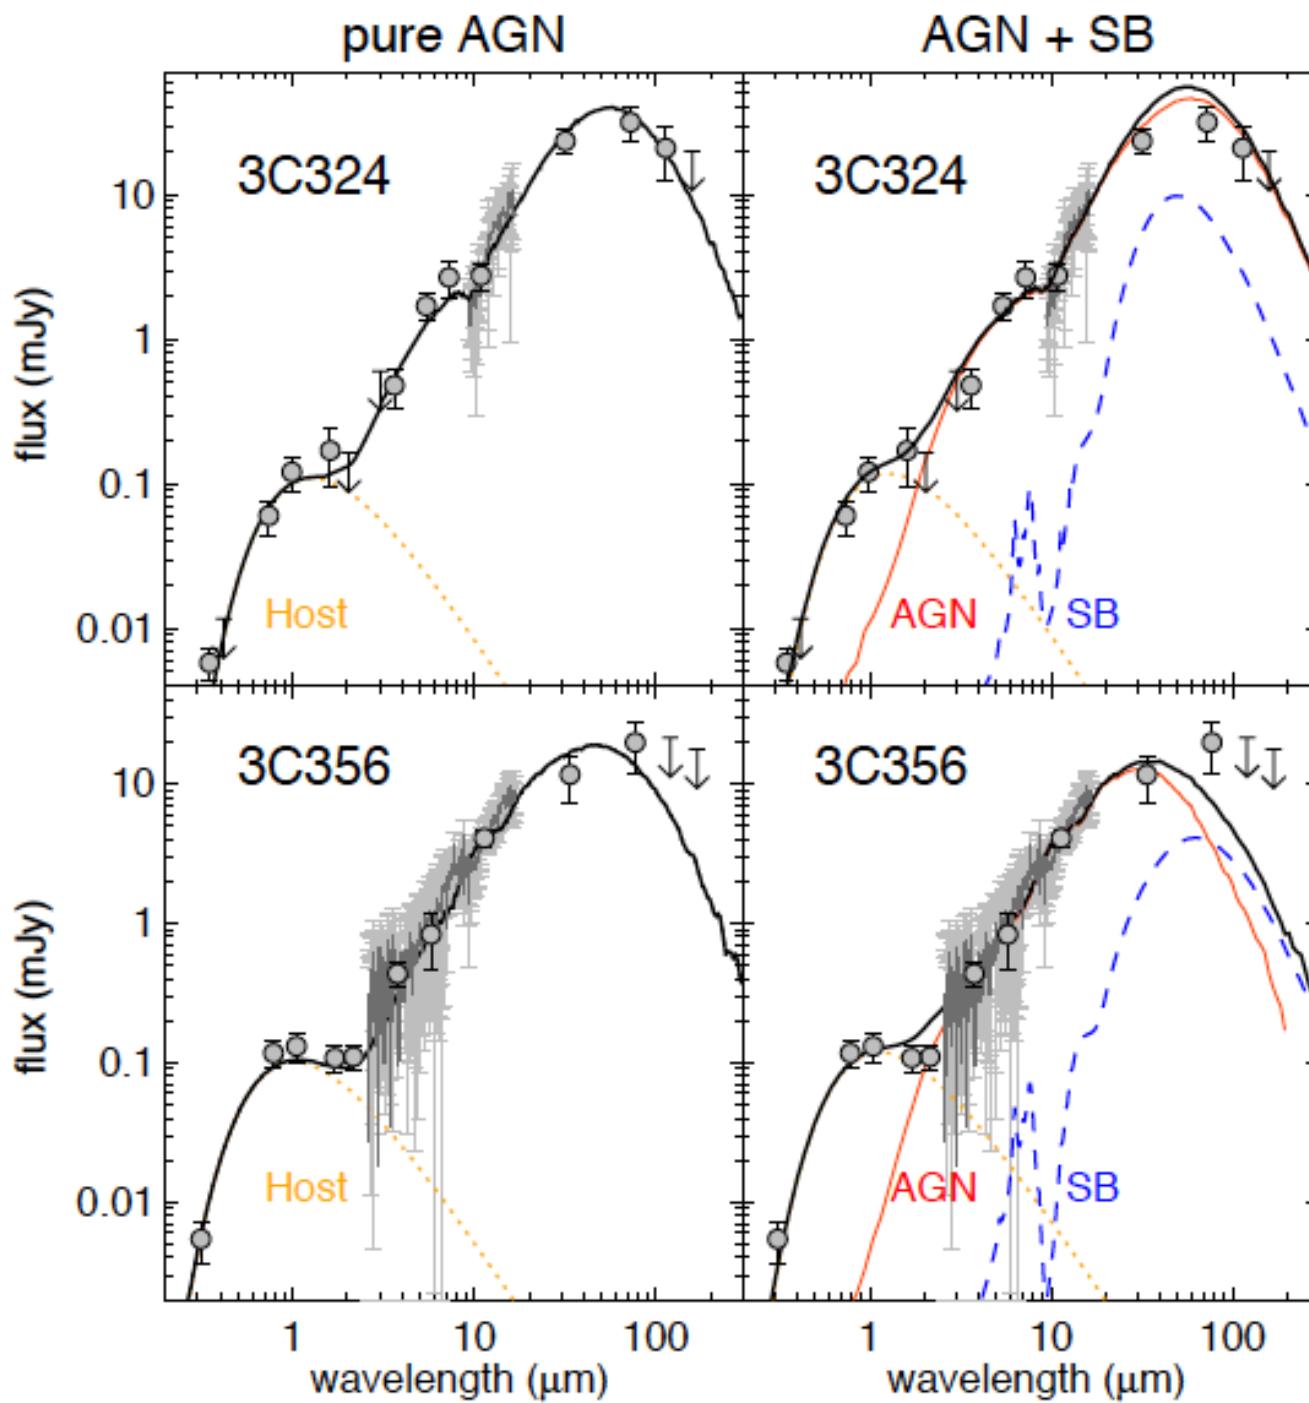

Type I

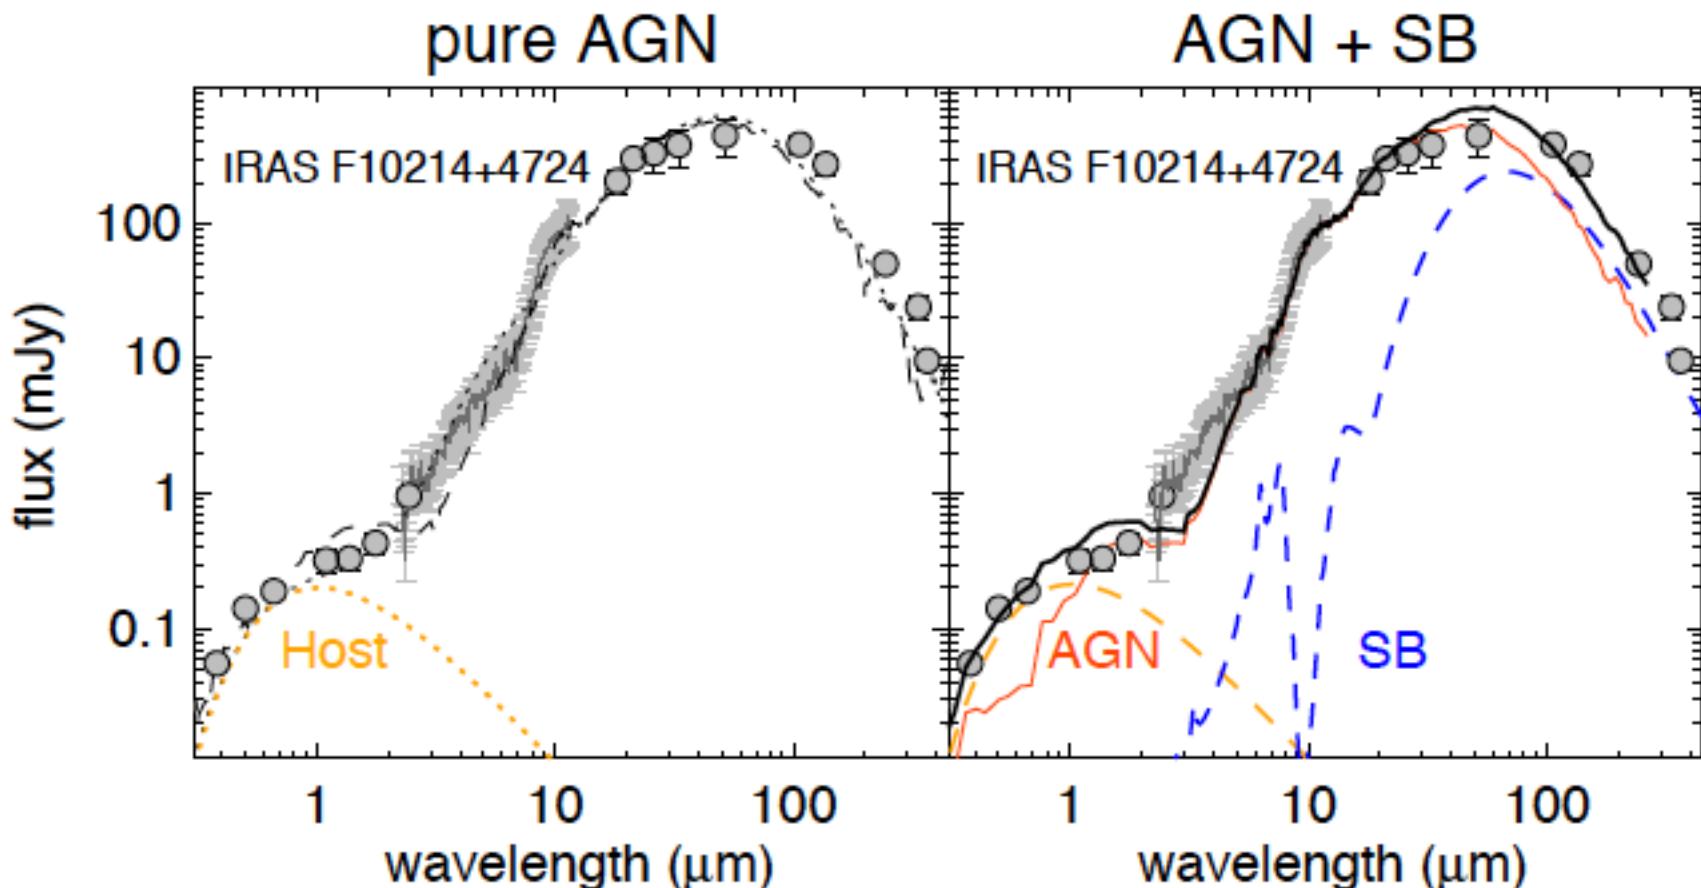

Type II

Hyper-luminous galaxy

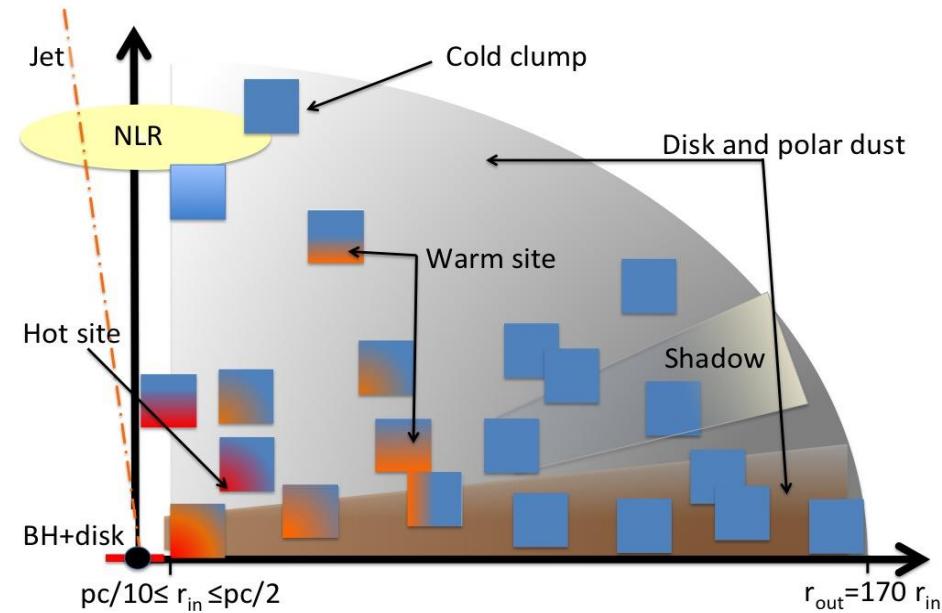

SED fitting methods: $MCMC \sim \chi^2$

Two-phase AGN tours model

SED library:

- 5 parameters
- Fluffy grains
- Estimate intrinsic L_{AGN}
- $10\mu\text{m}$ silicate band
- NIR: disk \leftrightarrow no disk

- Seyferts \leadsto AGN + host
- Type I+II \leadsto pure AGN (SB < 10%)
